

AEROLOOP

Give physical work a feedback loop.

A mission agent that decides, flies, verifies and retries before producing an auditable artifact.

WORK ORDER > DECISION > VERDICT

The first flight is not the inspection.

- 01 **PLAN** An inspector defines the route.
- 02 **CAPTURE** A pilot collects images and audio.
- 03 **REVIEW** The team checks evidence later.
- 04 **REPEAT** Missing evidence means another flight.

THE GAP

Coverage does not guarantee usable evidence.

AeroLoop closes the loop automatically.

One trigger. Bounded autonomy. Independent verdict.

NO HUMAN BETWEEN TRIGGER AND ARTIFACT

Human authority before | Qualified review after

Devin is the mission engineer. Not the motor controller.

BUILD-TIME ROLE

Writes and repairs control code

Runs tests > sees failures > fixes the system

Same engineering loop that improves software.

RUNTIME ROLE

Chooses bounded mission actions

Observes > decides > reacts to the verdict

One resumable API session preserves context.

DEVIN	targets / speed / standoff / next action
SAFETY	authorization / limits / action rejection
CONTROL	fast flight loop / motors / physics
VERIFIER	coverage / evidence / final disposition

The loop runs. Now judge it.

PRIMARY JUDGE LINK

OPEN MISSION CONTROL

Choose Devin live. Enter a mission. Watch decisions, safety checks, flight, evidence and the final verdict.

aeroloop-production.up.railway.app/mission_view.html

*Recorded live-Devin sample is small. Aircraft, sensors and environment are simulated; the agent loop, safety, controller, verifier and artifacts are real software.
